... Price: $15.00 Size: 2.3 Mb Get MyEnTunnel System tray and SSH tunnel daemon MyEnTunnel provides you with a system tray SSH tunnel daemon. It works as a Windows service, keeping the tunnels alive at all times through the Plink (PuTTY Link) application. What MyEnTunnel really does is monitoring Plink so that any time a connection drop occurs or the server restarts, the process is restarted in order for the TCP and SSH tunnels to perform flawlessly. While this may seem like a system resource grinder, MyEnTunnel performs at its best without that much fuss and even provides a "Slow Polling" option to further limit its resource utilization. Interface-wise, the application keeps everything simple and well-organized. The main and only window is divided into four tab sections varying from Status and Settings to Tunnels and License. The Status area informs you of all established connections, their creation date and time as well as ports and forwarding. In order to customize the program, you are required to fill in a few details regarding the server configuration. Beside its address and port plus your login information, you can access more options in relation to private keys, verbose logging, dynamic SOCKS or compression. You can quickly and easily manage your SSH tunnels within their dedicated section by manually entering them. One thing you must consider is the required correct syntax of your entries. You can find that just below the text box. At the bottom of the main interface window you find the controls of the application that help you connect to the server or send the program to the system tray. MyEnTunnel has a very simple color code for its system tray icon. Green, obviously, informs you that the SSH connection is established and stable, while the icon turns yellow on reconnection and, finally, red which indicates that an error stops the connection from being achieved. All in all, MyEnTunnel does a very good job at keeping TCP and SSH connections alive and this is its only purpose. Simple yet witty, this particular piece of software can be a trustworthy companion while working through a secure, encrypted tunnel. If that is the case of your daily as well as nightly activities, then you are just a few clicks away from a very handy application. KEYMACRO Description: ... Price: $15.00 Size: 2.3 Mb a353671387

Keymacro is a free and open-source program that allows you to record macro keystrokes from your computer keyboard. It's able to record the keyboard's contents on any Windows PC and the author has stated that he plans to add many features and features to the program. He also offers a direct download link that allows users to obtain the current version of the program. Features: It has several different features, such as the ability to record multiple keystrokes, the ability to record a specific event, the ability to record text written in the system clipboard, the ability to record any keystroke even if there is no keyboard attached, the ability to record any program on your computer, the ability to record any file, the ability to record any application, the ability to delete any recorded file at any time, the ability to set a limit of the maximum number of keystrokes to be recorded, and the ability to play any recorded file. How to use Keymacro: The main window of the program is just like any other Windows application. It has a regular start button that, when clicked, opens the program up. The name of the file that will be saved to your computer will be displayed in the bottom-right corner of the window. To record an event, click the button labeled Start Record at the bottom-right corner of the window. A small record button will appear below the name of the file in the bottom-right corner of the window. The Windows toolbar also contains a stop button that you can click to stop the recording. A settings button is also available so you can change some of the program's settings. To clear any recorded keystrokes, click the button labeled Clear at the bottom-right corner of the window. You can find the recorded file in the program's folder. After you find the file, you can play it back by clicking the button labeled Play.
