One of the most irritating aspects of being a ham is having to constantly switch between modes (e.g., DX, Contest, General) and all of the modes are running on different bands and sometimes even on different frequencies. It is also not always easy to keep track of your signal strength and what frequency you are using. LogPA is a data logging program that gives you the option to log the current frequency and power, your RX quality, the time you have been on the air, and even a brief description of the station you are working on. After the session is over, the current mode, frequency, and power can be recalled by pressing a button on the LogPA front panel. The program can also log data and then store the data to an external PC using the included serial port connection. LogPA runs on the Windows 95, 98, 2000, and ME operating systems, as well as the Mac OS X and Linux operating systems. Facts: Facts: I did my own graphics, icons, sounds, menus, etc. There are a lot of options to configure. I had to rewrite the main program, because I ran out of memory on the system. You can add your own stuff to the program (you just have to write it into the appropriate folder). The English version is translated into French, Spanish, German, Hungarian, Russian and Italian. Here are some screenshot: I have only tested this software on Windows XP. SoftSWIPE 1.1.5 SofwSWIPE is a program that helps you to clear the RAM and the SWAP partition of your computer. It is an applet for Windows and Mac OS X. In addition to cleaning your RAM, SofwSWIPE also automatically maximizes your window. It helps you to free the RAM memory and to use Windows correctly, without using your CPU and memory. The main features of SofwSWIPE are: - Clearing the RAM memory and the SWAP partition of your computer - An applet for Windows and Mac OS X - Optimizes the RAM memory and windows maximization - Allows you to use Windows normally, without slowing down your computer - Allows you to check the RAM memory and the SWAP partition EPS Radio Vector EPS Radio Vector is the software equivalent of vector graphic software such as Corel Draw, Adobe Photoshop, or Artlantis. It allows the creation of vector graphic

What's New In LogPA?

----- The program supports logging all stations and modes in 16 bands of the 160-1400 MHz range and all modes in 6 bands of the 4800-5700 MHz range. Data for all logging stations is displayed on a tabbed, paged HTML format. You can edit the format of the output by clicking on the format icons at the bottom of the program's window. The default format is very basic. In addition, you can easily create your own text files with the logging status information in it. The program is very easy to use. Simply click on the Log mode you want to use. The system will automatically scan for a repeater, a listening post, or an amateur radio station using the mode of operation you specify. The program will then report on the status of the station or posting. As each mode or station status is logged, you will see it appear in the corresponding log window. Current Limitations: ----- The program does not support logging of automatic calling protocols like AMTOR, AUTO, or QRM. It does not support logging of SSB or CW modes. The program does not support logging of "Internet via WU" modes. RSSI is not logged. System Requirements: ----- To use the program you will need a copy of Tcl/Tk 8.0 for Windows. You will also need the following software. AMS DX Scanners: One AMS DX Scanner (6.8 or greater) and one software copy of DXmap installed on your PC. DSU software: One version of the DSU software (3.1 or greater) installed on your PC. Known bugs: -----

System Requirements For LogPA:

Recommended: OS: Windows 10 64-bit CPU: i5 (2.5-3.5GHz), i7 (2.9-3.9GHz), Ryzen 5 (2.2-3.6GHz) RAM: 8GB+ Video: AMD Radeon™ RX 580 4GB GPU: AMD Radeon™ RX Vega 64 8GB Hard Drive: 12GB+ Keyboard & Mouse: Minimum: OS: Windows 7 64-bit CPU: Intel Core 2 Duo
