Industrial processes still require a high degree of supervision, especially when the inherent processes encompass a high number of complex operations. Specialized software is required for such complicated endeavors, such as SCADA LAquis. Designed specifically in order to offer supervisory control and data acquisition for industrial processes, it will offer users a highly customizable platform, which comes packed with a comprehensive set of features that address SCADA-related aspects. Tab-based layout, which emphasizes accessibility and offers a good overview of the portrayed industrial process The application offers a well-structured view of the industrial process file, which we believe is crucial for a better understanding and ease of handling. A tab array contains all parts of the process, disseminated into individual objects, making any tweak a quite accessible task. Furthermore, a main view of the entire process is also maintained, together with a handy side-panel, which offers a collapsible view of all the loaded layers, their corresponding sub-elements, and characteristics. Impressive collection of tools that can be used for performing intricate tweaks to the projects Dwelling deep into the app's menus, one will be able to find a multitude of tools, each with subsequent features, addressing some of the most commonly used techniques and parameters in SCADA approaches. These features accompany the on-screen commands that are available as quick access buttons, in order to create, what we believe to be a quite competent feature set. This will allow users to perform customization to the loaded industrial processes into the finest details, therefore yielding more accurate results. Highly specialized solution for those who need the closest supervision of their industrial, automated processes SCADA LAquis can provide reliable performance for attaining the desired industrial process monitoring, through a series of tools that offer a balanced approach towards the deployment of SCADA frameworks.
