The protective effect of sodium nitroprusside against adriamycin nephrotoxicity in the rat was assessed. Adriamycin given in a single dose (15 mg/kg i.v.) caused a significant (P less than 0.01) increase in urinary excretion of N-acetyl-beta-D-glucosaminidase (NAG), but a decrease in urinary beta2-microglobulin excretion. Sodium nitroprusside given in a single dose (100 mg/kg i.p.) 24 h before adriamycin prevented the adriamycin-induced increase in urinary NAG excretion, which was not observed with a lower dose of the drug (50 mg/kg i.p.). The protection afforded by sodium nitroprusside against adriamycin nephrotoxicity was more evident in male than in female rats. The protective effect of sodium nitroprusside on adriamycin nephrotoxicity was abolished by the simultaneous administration of L-arginine (1.5 g/kg i.p.), an inhibitor of nitric oxide synthesis. On the contrary

This class is responsible for storing and retrieving the settings for Skins. If you want to allow your program to change the appearance of your program when the user runs it, you need to implement Skins. A Skins allows your program to change the look of a window in the active desktop session, or to change the look of any window in your program. You can use Skins in any way that you want, and they're extremely flexible. In fact, you can create Skins to be the style of your own windows. (That's how Cracked SkinMagic With Keygen works.) The Skin class is very flexible, but this class is actually very simple, so it's perfect for beginners. Using Skins is very easy. You simply add your Skins to the SkinManager, and your Skins automatically work. The SkinManager has a static method, AddSkin, which adds a Skin to the Skins library. AddSkin adds a Skin to the Skins library, and automatically makes the appropriate Skin look for all windows in the program. If the target is a dialog, it will look like a dialog, and if it's a dialog, it will look like a shape. If the target is a window, it will look like a window. If it's a MFC form, it will look like a form. If it's a child window of a MFC form, it will look like a child window of a MFC form. If you are a developer of Windows applications, you can use the Skins library to make your own application look like a Windows program. For example, you can create a look that resembles Windows 95. You can change the look of your program with Skins, without having to change your program. You can make a look for your program that is completely different from the look that the system uses. When using Skins, you are using a particular look (for example, "Win95") that will affect any window in the system that has that look. So you can have your program look exactly like it does in Windows 95, or you can have it look exactly like it does in Windows 98. When the user launches the program, the Skins are automatically applied, and they look like the look that the user selected. (That means that if the user chooses the look that looks like Win95, the program looks like Win95.) If you want to have a different look for the user when they run the program, you don't have to change the program 1d6a3396d6

The skins provide three main features: [The ability to apply them to a MediaWiki site](#) [The ability to specify a custom theme to use](#) [The ability to add items to the toolbar](#) The skins are in the 'contrib' section of the MediaWiki site, so must be downloaded separately. They are not yet enabled by default in the install process, but can be enabled when running the MediaWiki software. The MediaWiki site skins repository is maintained by an open source project called MediaWikiSkins
